Measurement Scales:

Measurement Scales are defined as: The device or an object used To measure or quantify any event or an object is Called measurement scales.

There are Four types of measurement scales:

Nominal Scale.
Ordinal Scale:
Interval Scale.
Ratio Scale.

DAY: ______ DATE: ______

Nominal Scale: Nominal scales are defined as:
"The scales that are used to cetagorize data into groups."

Numbers serve as tags or labels to classify or identify the objects.

Example Gender, Country, players of any team the T-shirts number's etc.

Ordinal Scale: Ordinal Scale is defined as:
The scale that are used to measure variables in a natural order, such as rating or ranking.

They provide meaningful insights.

DAY: ________ DATE: ________

Example: Ranking of class students on the bases of examination (1^{st}, 2^{nd}, 3^{rd}).

Interval Scale: Interval Scale are defined as:
Scales Used to ~~class~~ quantifice the data in equal interval between values.
No true absolute zero.

Example: Temperature in celsius.
IQ levels or scores.

Ratio Scale: Ratio Scale can be defined as:
Data divided into orders or ranks. Data points can be quantified.
Existance of absolute zero values.

DAY: ____________ DATE: ____________

Don't have negative values.

Example: Height of a person. Weight, age income etc.

Steps involv in research design:

1) **Identify the research problem's:** Clearly define what you want to study or solve.

ii) **Review of literature:** Study existing research related to your topic.

iii) **Formulate objective:** Set clear aims or hypothesis to test.

(iv) **Choose the research design type:** Decide between qualitative quantitative or mixed method.

v) **Define Variable:** In identifying independent and control variables.

DAY: DATE:

Select the Sample: Choose your target population and sampling method.

Select data Collected method: Use tools like surveys, interviews, experiments or observations.

Plan for data analysis: Choose statistical tools or quantitative method.

Consider ethical issues: Ensure informed consent, confidently and ethical approve.

Prepare research timeline: Set deadlines and estimate costs.

Finalize research design: Review everything and get ready for implementation.

DAY: DATE:

Dependent Variables: The variables that you measure or observe its effects or outcomes.

Example: Growth of plants, number of leaves.

Independent Variables: The variables that you can change or control in an experiment.

Example: Type of fertilizers
