(12) The limitations of green chemistry are following:

- Initial cost of implementing green chemistry can be higher.
- Scaling up green chemistry technologies poses technical challenges
- Green alternatives may not always match the performance of conventional chemicals
- Existing regulations may not fully support or incentivize green chemistry.
- Awareness and education gaps hinder widespread adoption
- Some green technologies require significant resources like energy and materials.

⇒

Q What is meant by eutrophication?

Give its main reasons:

Ans On page no. 131, 132 & 133

Q Define leaching?

Ans ~~Leaching~~ Leaching is the process by which water or other solvents dissolve and carry away nutrients or contaminants from the soil to another substance. This movement occurs as water percolates through the soil, carrying dissolved substance with it, which can lead to nutrient depletion in the soil or contamination of groundwater.

Q Give soil conservation methods to prevent soil erosion?

Ans These methods are:-

- Terracing:

- Steps on sloped land to slow water runoff and prevent erosion.

- Cover cropping:

- Planting crops year-round to shield soil from erosion and improve

health.

- Conservation Tillage:

- minimal soil disturbance to preserve structure and reduce erosion.

- Windbreaks:

- Rows of trees or shrubs to deflect wind and prevent erosion

- Contour Buffer strips:

- Vegetation across slopes to slow runoff and stabilize soil

- Mulching:

- Covering soil with materials to protect from erosion and improve health.

- Contour plowing:

- Plowing along slope contours to slow runoff, reduce erosion and enhance soil water infiltration, preserving fertility and structure

Conservation Tillage
