Qualitative Data Analysis

- Qualitative data are data in the form of words. Examples of qualitative data are interview notes, transcripts of focus groups, answers to open-ended questions, transcriptions of video recordings, accounts of experiences with a product on the Internet, news articles, and the like
 1. **Data Reduction:** refers to the process of selecting, coding, and categorizing the data.
 2. **Data Display:** refers to ways of presenting the data. A selection of quotes, a matrix, a graph, or a chart illustrating patterns in the data may help the researcher (and eventually the reader) to understand the data.
 3. **Drawing Conclusion**

Step 1: Qualitative Data Analysis-Data Reduction

- **Data Coding:** Coding is the analytic process through which the qualitative data that you have gathered are reduced, rearranged, and integrated to form theory.

- **Example:**

After the meal I asked for the check. The waitress nodded and I expected to get the check. After three cigarettes there was still no check. I looked around and saw that the waitress was having a lively conversation with the bartender.

Themes:

- The waitress does not provide service at the time she promises
- The waitress pays little attention to the customer

Codes:

- Delivery Commitments
- Personal Attention

Step 1: Qualitative Data Analysis-Data Reduction

Categorization: is the process of organizing, arranging, and classifying coding units. Codes and categories can be developed both inductively and deductively.

Instigations of anger in service consumption settings

(Sub)category	(Sub)category definition	No. of behaviors	No. of behaviors in % of behaviors	No. of behaviors in % of incidents	No. of behaviors in single-factor incidents	No. of behaviors in multi-factor incidents	Example(s)
Procedural failures							
Unreliability	Service firm does not perform the service dependably.	156	17.61	26.00	73	83	
Delivery promises	Service provider does not provide services at the time it promises to do so.	104	11.74	17.33	42	62	Wait for appointment with dentist, physician, or hairdresser, or on a plane, train, or taxi.
Service provision	Service provider does not provide the service that was agreed upon.	40	4.52	6.67	22	18	Client receives different car than agreed upon with car rental company or different apartment than agreed upon with travel agent. Bicycle repairers, car mechanics, or building contractors carry out different work than agreed upon or work that was not agreed upon with their clients.
Pricing	Price agreements are broken.	12	1.35	2.00	9	3	"After a party we called a cab. We were with a party of five. A van would take us home for a fixed, low price. However, upon arrival, the driver asked the regular clock price."

Steps 2 & 3: Qualitative Data Analysis- Data Display and Conclusion

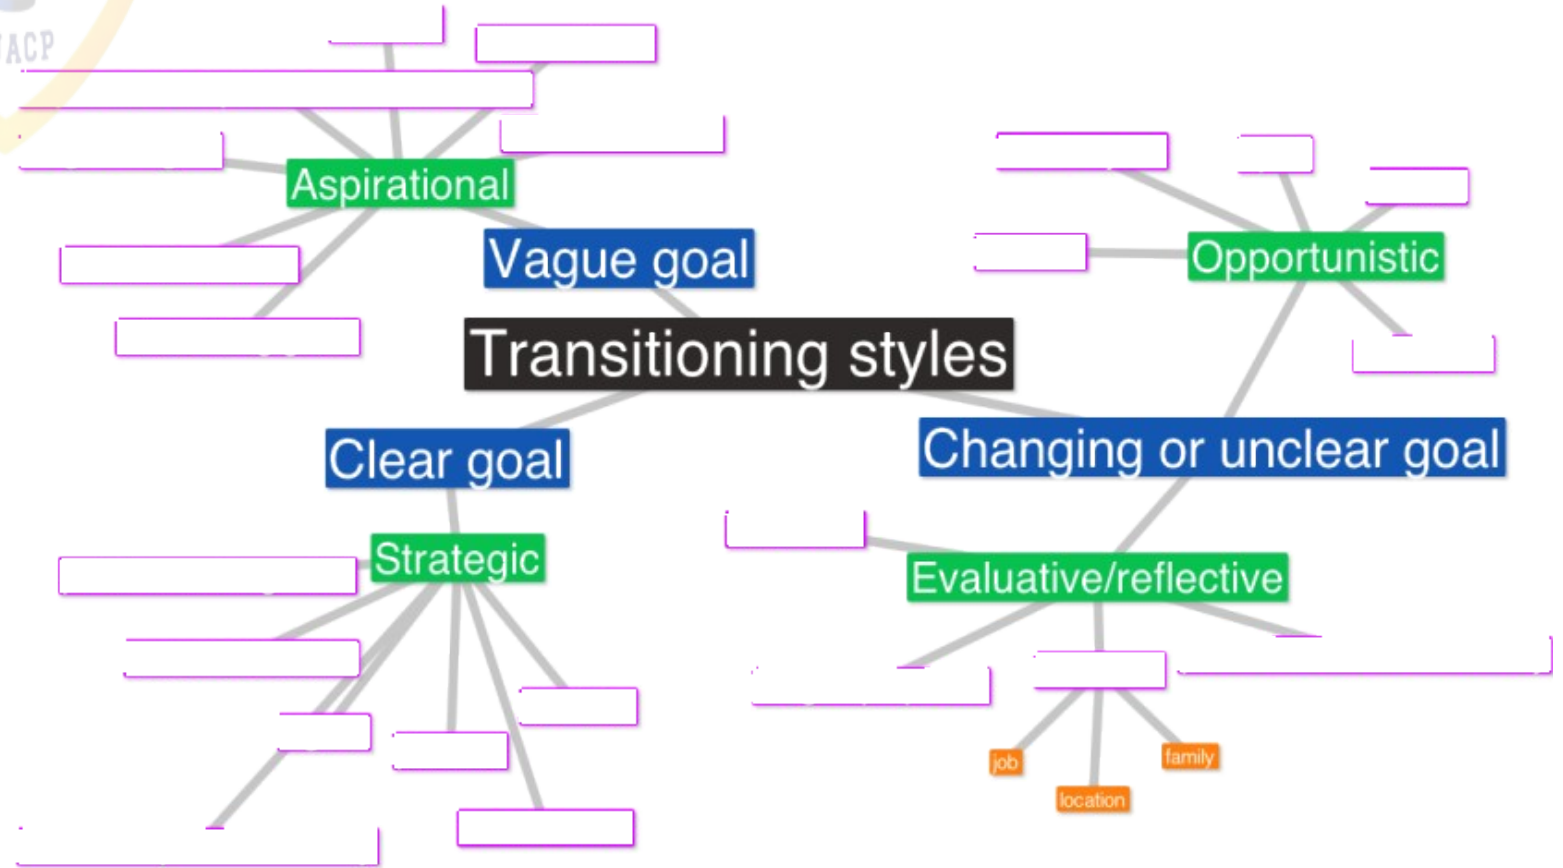

- **Data Display:** involves taking your reduced data and displaying them in an organized, condensed manner.
- **Conclusion:** drawing is the “final” analytical activity in the process of qualitative data analysis. It is at this point where you answer your research questions by determining what identified themes stand for, by thinking about explanations for observed patterns and relationships, or by making contrasts and comparisons.

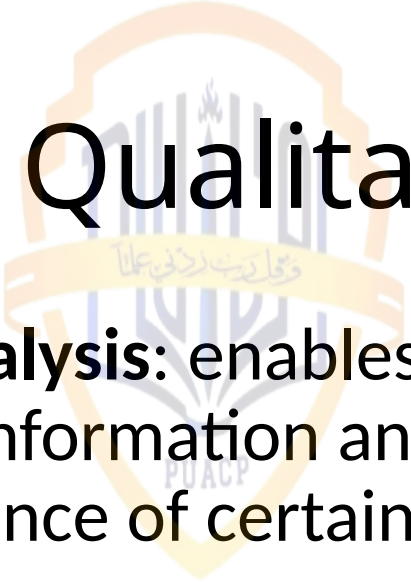

Software for Qualitative Data Analysis

Logo of the Punjab University Academic Council (PUACP). The logo is circular with a yellow border. Inside, there is a blue shield containing a white torch and the text "PUNJAB UNIVERSITY" in English and "پنجاب یونیورسٹی" in Urdu. Below the shield, the acronym "PUACP" is written in blue. A yellow banner across the middle contains the Urdu text "وقار و رزاقی علم".

- [illegible]

Qualitative Data Analysis

- **Content Analysis:** enables the researcher to analyse (large amounts of) textual information and systematically identify its properties, such as the presence of certain words, concepts, characters, themes, or sentences.
- **Conceptual Analysis:** analyses and interprets text by coding the text into manageable content categories according to certain concepts.
- **Relational analysis:** builds on conceptual analysis by examining the relationships among concepts in a text.
- **Narrative analysis:** is an approach that aims to elicit and scrutinize the stories we tell about ourselves and their implications for our lives.

Class Activity!

- Make a group of five members
- Set a research question
- Assign roles of interviewer and interviewees.
- Prepare semi-structured interview questions.
- Interview the interviewees.
- Conduct analysis according to the steps

Let's complete the report!
