

Guess paper

Computer (COMP-111

(Introduction and Applications)

Bs English Semester 1

Most important questions short +Long with solution

Imp Questions Short

Define Data Communication?

2) What is a Touchpad?

3) Explain Header and footer in ms word?

4) what is a modem and also name its Types?

5) What is biometric input?

6) Define network and protocol?

7) What are the types of Computer networks?

8) Differentiate b/w web page and URL?

9) What do you mean by multitasking?

10) Differentiate b/w database and database management?

4) Differentiate b/w impact and non-impact Printer?

12) What do you mean by computer security?

(13) What are the advantages of using database?

14) Define the internet? How does the internet work?

15) What are the major components of a computer network?

16) Differentiate b/w intranet and internet?

17) Differentiate b/w volatile and nonvolatile. memory?

18) Differentiate b/w single tasking and Multitasking?

19) What is ALU?

20) What is the use of Biometrics?

21) Differentiate b/w CLI and GUI?

22) Differentiate b/w RAM and Rom?

23) What does application Software mean?

24) Define website hosting?

25) What are supercomputers?

26) What are impact Printers?

27) What is WAN?

28) Describe the function of Arithmetic and logic units?

29) what does mean by device driver software

30) What is online searching?

31) What is Flash memory?

32) What is a Line Printer?

33) What is software?

34 Differentiate b/w Data and information?

35) What are input devices?

36) What word art in ms word?

37) What are forms in Ms Access?

Answers—

1. Data communication is the exchange of data between devices via some form of transmission medium such as wires or airwaves.

2. A touchpad is an input device commonly found on laptops that allows users to control the cursor on the screen by swiping or tapping on its surface.

3. In Microsoft Word, a header is text or graphics that appear at the top of each page, while a footer is text or graphics that appear at the bottom of each page. They are often used for page numbers, document titles, or other repeating information.

4. A modem is a device that modulates and demodulates digital signals to allow computers to transmit data over communication lines. Types include DSL, cable, and fiber optic modems.

5. Biometric input refers to the use of biological characteristics, such as fingerprints or iris scans, to authenticate a person's identity for access to a system or device.

6. A network is a collection of computers and other devices interconnected for sharing resources and

information. A protocol is a set of rules governing the exchange of data between devices in a network.

7. Types of computer networks include LAN (Local Area Network), WAN (Wide Area Network), MAN (Metropolitan Area Network), WLAN (Wireless Local Area Network), and PAN (Personal Area Network).

8. A web page is a single document displayed on the World Wide Web, while a URL (Uniform Resource Locator) is the address used to access a specific web page or resource on the internet.

9. Multitasking refers to the ability of an operating system to execute multiple tasks simultaneously, allowing users to run multiple applications at the same time.

10. A database is a structured collection of data, while database management involves the organization, storage, and retrieval of that data using specialized software.

11. Impact printers use a mechanism to physically strike an ink ribbon and paper to create text or images, while non-impact printers, like laser or inkjet printers, do not physically touch the paper.

12. Computer security involves measures taken to protect computer systems and data from unauthorized access, use, or damage.

13. Advantages of using a database include data organization, efficient data retrieval, data integrity, data security, and concurrent access by multiple users.

14. The internet is a global network of interconnected computers that communicate using standard protocols such as TCP/IP. It works through a decentralized system of servers and routers that relay data packets between devices.

15. Major components of a computer network include nodes (such as computers and servers), network devices (such as routers and switches), transmission media (such as cables and wireless signals), and protocols.

16. An intranet is a private network that operates within an organization, while the internet is a public network that connects millions of networks worldwide.

17. Volatile memory loses its data when power is removed, while nonvolatile memory retains data even when power is turned off.

18. Single tasking involves executing one task at a time, while multitasking involves executing multiple tasks simultaneously.

19. ALU (Arithmetic Logic Unit) is a fundamental component of a computer processor responsible for performing arithmetic and logical operations.

20. Biometrics is used for authentication and identification based on unique biological traits like fingerprints, iris patterns, or facial features.

21. CLI (Command Line Interface) requires users to type commands to interact with the computer, while GUI (Graphical User Interface) allows users to interact with the computer using graphical elements such as icons and windows.

22. RAM (Random Access Memory) is volatile memory used for temporary storage, while ROM (Read-Only Memory) is nonvolatile memory used for permanent storage of essential system instructions.

23. Application software refers to programs designed to perform specific tasks for users, such as word processing, spreadsheet analysis, or graphic design.

24. Website hosting is a service that allows individuals or organizations to make their website accessible via the World Wide Web by storing their website files on a server connected to the internet.

25. Supercomputers are extremely powerful computers designed to process complex calculations and simulations at very high speeds, typically used for scientific and engineering applications.

26. Impact printers create characters or images by physically striking an inked ribbon onto paper, while non-impact printers create characters or images without direct contact with the paper.

27. WAN (Wide Area Network) is a network that covers a broad geographical area and connects multiple LANs and other networks.

28. The Arithmetic Logic Unit (ALU) performs arithmetic and logical operations on data in the CPU, such as addition, subtraction, AND, OR, and NOT operations.

29. A device driver software is a program that allows the operating system to communicate with hardware devices by translating high-level commands into specific commands understood by the device.

30. Online searching involves using search engines or databases to find information on the internet.

31. Flash memory is a type of nonvolatile memory that retains data even when power is turned off, commonly used in USB drives, memory cards, and solid-state drives (SSDs).

32. A line printer is a type of printer that prints one line of text at a time, typically used for high-volume printing in business environments.

33. Software is a set of instructions that tell a computer how to perform specific tasks or operations.

34. Data refers to raw facts or figures, while information is data that has been processed or organized to be meaningful.

35. Input devices are hardware devices used to provide data and control signals to a computer, such as keyboards, mice, scanners, and microphones.

36. WordArt in Microsoft Word is a feature that allows users to create decorative text by applying various styles, effects, and formatting options.

37. Forms in Microsoft Access are graphical user interfaces used to enter, edit, or view data in a database table. They provide a structured way to input data and interact with the database.

Long Questions.

Explain types of storage devices?

2) How to safeguard your personal information?

3) Define input devices? All major types of input devices?

4) What are the main types of computer? Describe in detail their usage in real life?

5) write a method of creating a Presentation in Ms Powerpoint? write any two features of MS PowerPoint with their uses and application?

6) Describe and explain the if-else formula in ms-excel with an example also write a method of creating and formatting Charts in MS-Excel?

7) write a brief note on types of operating system?

8) What is the difference b/w compiler and interpreter?

9) What is a database? Explain two applications.

10) Write a Brief note on the operating system?

1. **Types of Storage Devices:**

- Hard Disk Drives (HDD): These are the most common storage devices in computers, using magnetic storage to store data.

- Solid State Drives (SSD): SSDs use flash memory to store data, offering faster read/write speeds and better durability compared to HDDs.

- USB Flash Drives: These portable storage devices use flash memory and connect to computers via USB ports.

- Optical Discs: Examples include CDs, DVDs, and Blu-ray discs, which use laser technology to read and write data.

- Memory Cards: Used in cameras, smartphones, and other devices, memory cards store data electronically and are often removable.

- Cloud Storage: Online services such as Google Drive, Dropbox, and iCloud provide storage space on remote servers accessible via the internet.

2. **Safeguarding Personal Information:**

- Use strong, unique passwords for each online account and consider using a password manager.

- Be cautious about sharing personal information online and only provide it to trusted sources.
- Enable two-factor authentication whenever possible to add an extra layer of security to your accounts.
- Regularly update software and antivirus programs to protect against security vulnerabilities and malware.
- Avoid clicking on suspicious links or downloading attachments from unknown sources in emails or messages.

3. ****Input Devices:****

Input devices are hardware components that allow users to interact with a computer by providing data or commands. Major types include:

- Keyboard: Used for typing text and entering commands.
- Mouse: Used for pointing, clicking, and navigating on-screen elements.
- Touchscreen: Allows users to interact with a display directly by touching it.
- Scanner: Converts physical documents or images into digital format.
- Webcam: Captures video or images for communication or recording purposes.
- Microphone: Records audio input, such as voice commands or conversations.

4. ****Types of Computers:****

- Personal Computers (PCs): Used for general-purpose computing tasks such as web browsing, word processing, and gaming.
- Workstations: Powerful computers optimized for specialized tasks like graphic design, engineering, and scientific simulations.
- Servers: Computers dedicated to providing services or resources to other computers on a network, such as hosting websites or managing data storage.
- Mainframes: Large, high-performance computers capable of handling massive amounts of data processing and multiple simultaneous users.
- Supercomputers: Extremely powerful computers used for complex calculations and simulations in fields like weather forecasting, scientific research, and cryptography.

5. ****Creating a Presentation in MS PowerPoint:****

- Open Microsoft PowerPoint and select a new blank presentation.
- Add slides by clicking on the "New Slide" button or selecting a layout from the "Home" tab.
- Insert text, images, charts, or other multimedia elements onto each slide.
- Organize and format slides using design templates, themes, and layout options.

- Add animations, transitions, and speaker notes to enhance the presentation.

- Save the presentation to your desired location and optionally share it with others.

****Features of MS PowerPoint:****

- Slide Master: Allows users to define and customize the overall layout, formatting, and design of presentation slides.

- Animation and Transition Effects: Enables users to add dynamic movement and visual effects to slides for engaging presentations.

6. **If-Else Formula in MS Excel:**

- The IF function in Excel allows you to perform a logical test and return one value if the test is true and another value if the test is false. For example:

'''

=IF(A1>10, "Yes", "No")

'''

This formula checks if the value in cell A1 is greater than 10. If true, it returns "Yes"; otherwise, it returns "No".

****Creating and Formatting Charts in MS Excel:****

- Select the data range you want to include in the chart.

- Go to the "Insert" tab and choose the type of chart you want to create.

- Customize the chart elements, such as titles, axes, and legends, by clicking on them and using the formatting options.

- Adjust the chart type, style, colors, and other properties to suit your preferences.

- Once the chart is created and formatted as desired, you can resize, move, or copy it to other locations within the spreadsheet.

7. **Types of Operating Systems:**

- Single User, Single Tasking: Only one user can interact with the system at a time, and it can perform only one task at a time.

- Single User, Multi-Tasking: Allows one user to perform multiple tasks simultaneously.

- Multi-User: Supports multiple users accessing the system and running programs concurrently.

- Real-Time: Designed for systems that require immediate processing of data and responses to external events, such as industrial control systems and embedded systems.

8. **Difference Between Compiler and Interpreter:**

- Compiler: Translates entire programs written in high-level programming languages into machine code or intermediate code before execution. The resulting executable file can be run independently of the compiler.

- Interpreter: Translates and executes high-level code line by line, converting it into machine code or intermediate code at runtime. It does not produce an independent executable file but interprets the code on the fly.

9. **Database:**

- A database is a structured collection of data organized and stored in a way that allows for efficient retrieval, manipulation, and management.

- Two applications of databases include:

1. **Customer Relationship Management (CRM):** Used by businesses to manage and analyze customer data, track interactions, and improve customer satisfaction.

2. **Inventory Management:** Used to track and control inventory levels, monitor stock movements, and optimize supply chain operations.

10. **Operating System:**

- An operating system is system software that manages computer hardware, software resources, and provides common services for computer programs.

- It acts as an intermediary between the user and the computer hardware, facilitating communication and coordination between hardware components and software applications.

- Operating systems perform essential tasks such as managing memory, controlling input and output devices, scheduling tasks, and providing a user interface for interaction with the computer.
