

COMPUTER'S PAST PAPER

1st semester BS Economics

Paper code: 111

Document created by

EnAN (23612)

PAST PAPER 2015

Flash memory is a type of computer storage that can store data even when the power is turned off. It is used in devices like USB drives, memory cards, and SSDs. Flash memory works by trapping electrons in a transistor, and can be written to and read from quickly and reliably.

Data communication refers to the transfer of digital between two or more devices through a communication medium, such as wires, cables, or wireless signals. It involves the encoding, transmission, and decoding of data, and can occur over short or long distances.

An impact printer works by physically striking an ink ribbon against paper, leaving an imprint on the page. It creates noise when printing and requires ink ribbons to be replaced periodically. Examples include dot matrix and typewriter printers.

A non-impact printer, on the other hand, does not physically strike the paper. Instead, it uses ink, toner or thermal transfer to produce an image. It is quieter and

generally produces higher quality printouts. Examples include inkjet, laser and thermal printers

A touchpad is a rectangular surface located on a laptop, tablet, or phone that allows users to control the movement of the cursor or pointer on the screen by sliding their finger across it. It functions similarly to a computer mouse but is built into the device itself.

A header is a section at the top of a page in MS Word where you can add information such as a page number, document title, or author name.

A footer is a section at the bottom of a page in MS Word where you can add information such as a page number, date, or copyright notice.

A Database is a collection of structured data that is organized and stored for efficient retrieval and manipulation.

A Database management system (DBMS) is a software system that manages and controls access to the database, allowing users to store, retrieve, and modify data with ease while ensuring data integrity and security.

Biometric input refers to the process of using a person's unique physical characteristics, such as fingerprints, facial features, or iris patterns, to verify their identity.

LAN (Local Area Network) - A network that connects devices in a small geographic area like a home or office.

WAN (Wide Area Network) A network that connects devices over a large geographic area like a city or country.

MAN (Metropolitan Area Network) - A network that connects devices in a city or metropolitan area.

WLAN (Wireless Local Area Network) - A wireless network that connects devices in a small geographic area.

Computer security refers to the protection of computer systems and information from unauthorized access, theft, damage, or other forms of malicious or accidental harm.

A modem is a device that allows computers to communicate with each other over telephone or cable lines. There are two types of modems: dial-up modems, which connect to the internet through a phone line, and broadband modems, which connect to the internet through a cable or DSL line.

2017

A webpage is a document that contains information, including text, images, and videos, that is presented on the internet. An example of a webpage is the home page of a website like google.com.

A URL, or Uniform Resource Locator, is the address that identifies the location of a specific webpage on the internet. An example of a URL is

https://www.youtube.com/@Arsh_beauty_saloon?si=uEW3qZ76k91N8vFc

It's a YouTube channel (Arsh Beauty Saloon) link.

A Dual-Core microprocessor has two processors working together to handle tasks, while a Quad-Core microprocessor has four processors working together to handle

tasks. This means that a Quad-Core processor can handle more complex and demanding tasks than a Dual-Core processor.

A machine cycle is the series of steps that a computer's central processing unit (CPU) goes through to execute a single instruction. It typically includes fetching the instruction, decoding it, executing it, and storing the results.

The **resolution and the quality** of the camera lens are the two key factors that play a vital role in determining the picture quality. The higher the resolution and the better the lens quality, the sharper and more detailed the image will be.

LCD stands for Liquid Crystal Display, which uses a backlight to illuminate the pixels and create an image.

LED stands for Light Emitting Diode, which uses an array of tiny LEDs to directly produce light and create an image with better color accuracy and energy efficiency.

A web browser is a software application used to access and display websites on the internet.

Examples of web browsers include Google Chrome, Brave, Tor (use to access dark web) and Mozilla Firefox.

A database is a collection of structured data that is organized and stored for efficient retrieval and manipulation.

A database management system (DBMS) is a software system that manages and controls access to the database, allowing users to store, retrieve, and modify data with ease while ensuring data Integrity and security.

Modulation is the process of encoding information onto a carrier signal to enable transmission over a communication channel.

Demodulation is the process of extracting the original Information from a modulated carrier signal at the receiving end of the communication channel.

An **Excel workbook** is a file that contains one or more worksheets. Think of it as a container for holding multiple sheets of paper.

A **worksheet** is a single page or sheet within an Excel workbook. It's where you enter and manipulate data, perform calculations, and create charts and graphs.

2019

System software is a type of software that provides a platform for running application software and manages the computer's hardware resources. Examples include operating systems and device drivers.

Application software, on the other hand, is designed to perform specific tasks or solve specific problems. Examples include word processors, web browsers, and video games.

A **hardcopy** is a physical printout of a document, Image, or information that can be held, seen, and touched.

A **softcopy** is a digital version of a document, image, or information that is displayed on a computer screen and can be easily edited and shared electronically.

A barcode is a series of lines and spaces that represent data and is used for quickly and accurately identifying products or information.

A **computer network** is a collection of computers and other devices that are connected together to share information and resources. It allows users to communicate and share data with each other.

The Internet is a global network of interconnected devices and servers that allows people all around the world to access and share information.

Intranet is a private computer network that is used within an organization to share information and resources. It is accessible only to authorized personnel.

Web hosting refers to the service of providing storage space and access for websites on the internet. It allows individuals and organizations to make their websites accessible to the public via the World Wide Web.

Single tasking refers to the act of focusing on one task at a time, without allowing other distractions or tasks to interfere with it. It involves dedicating your full attention to completing one specific task before moving on to the next one.

A database is a structured collection of data that is stored and organized in a way that allows easy retrieval and manipulation of information. It acts as a central repository of information that can be accessed and managed by multiple users and applications.

ROM stands for Read-Only Memory, which is a type of computer memory that can only be read from, but not written to. It is used to store permanent data such as firmware and software that needs to be retained even when the computer is turned off.

RAM stands for Random Access Memory, which is a type of computer memory that can be both read from and written to. It is used to temporarily store data that the computer is currently working on, and is cleared when the computer is turned off.

Radio frequency identification (RFID) is a technology that uses radio waves to identify and track objects, and it's used in daily life for things like inventory management, contactless payments, and tracking pets.

2020

Hardware refers to the physical components of a computer system, such as the processor, memory, and input/output devices.

Software refers to the programs and instructions that run on the computer system, including the operating system, applications, and utilities.

SSD stands for Solid State Drive, and it's a type of storage device that uses flash memory to store data. **SSDs** are faster and more reliable than traditional hard drives, making them a popular choice for computer storage.

A **hub** and a **switch** are both devices used to connect multiple devices to a network. However, a hub broadcasts data to all connected devices, while a switch sends data only to the intended device, making it more efficient.

Single tasking refers to the ability to focus on and complete one task at a time, while multitasking refers to the ability to handle multiple tasks simultaneously or switch between tasks quickly.

CLI (Command Line Interface) is a text-based interface that allows users to interact with a computer system by typing commands, while GUI (Graphical User Interface) is a visual interface that uses icons, menus, and windows to interact with a computer system through a mouse or touch input.

A search engine is a tool that helps you find information on the internet by allowing you to enter keywords or phrases, and it provides a list of relevant websites and resources based on your search query.

2021

UPC stands for Universal Product Code. It is a unique barcode used to identify products and make them easily scannable for pricing and inventory purposes in stores.

MICR, or Magnetic Ink Character Recognition, is a technology that uses special ink and magnetic properties to encode and read information on checks, enabling efficient processing and verification by banking systems.

3D-sheets in Microsoft Excel allow you to work with multiple worksheets simultaneously as if they were stacked on top of each other, making it easier to analyze and manage data across different sheets.

Artificial intelligence (AI) refers to computer systems or machines that can perform tasks that typically require human intelligence, such as learning, problem-solving, and decision-making, based on data and algorithms.

A record in a database refers to a single, complete set of related data. It is like a row in a spreadsheet. containing all the information about a specific entity or item.

To **calculate the average** of cell B2 and B3 in Excel, you can use the following formula: $= (B2+B3)/2$.

This formula adds the values in cells B2 and B3 and then divides the sum by 2 to calculate the average.

A robot is a machine that can be programmed to perform tasks automatically. without the need for human intervention. It is a mechanical device designed to carry out specific functions and can often mimic human actions and behaviors:

Multitasking: it refers to the ability of a single computer system to perform multiple tasks concurrently b, rapidly switching between them.

FLOPPY DISK

- It is magnetic disk made up of plastic.
- Initially it was used as main storage device but now-a-days it is not used as the main storage device of computer.
- It contains single plastic disk.

HARD DISK

- It is magnetic disk made up of aluminum.
- It is used as main storage device of computer.
- it uses metallic disk called as platter.

2022

SRAM (Static Random Access Memory) is a type of computer memory that is faster and more expensive than DRAM, but it does not require refreshing and stores data as long as power is supplied.

DRAM (Dynamic Random Access Memory) is a type of computer memory that is slower and cheaper than SRAM, but it requires constant refreshing to retain data, making it volatile.

A magnetic strip card is a small plastic card that stores data using a magnetic stripe, which can be read by card readers to access information or perform transactions.

Machine language programs execute faster because they are directly executed by the computer's hardware without the need for interpretation or translation.

The causes of **computer viruses** include downloading infected files, visiting malicious websites, and opening infected email attachments.

CPU registers are small storage areas within a computer processor that hold data temporarily during the execution of a program.

CAD (Computer-Aided Design) is the use of computer software to create digital models and designs of products, structures, or systems.

CAM (Computer-Aided Manufacturing) is the use of computer software and machinery to control and automate the manufacturing process based on the designs created in CAD.

Web publishing is the process of creating and sharing content on the internet for others to access. It involves designing and uploading websites, blogs, or other online materials to make them available to a wide audience.

Active cell: The currently selected cell in which data can be entered or modified.

Passive cell: A cell that is not currently selected or being actively worked on.

Yes, we can **recover a deleted file** in Windows by using file recovery software or checking the Recycle Bin.

1. Command Line interface (CLI) Operating System: Requires users to interact with the system through text-based commands.

2. Graphical User Interface (GUI) Operating System: Allows users to interact with the system through visual elements such as icons, menus, and windows.

An extended partition is a special type of partition on a computer's hard drive that can be divided into smaller logical partitions. It allows you to create more than four partitions on a disk.

To **add five cells** in a row (A1, A2, A3, A4, A5) in MS Excel, you can use the following formula: =SUM (A1:A5). This formula adds the values in cells A1, A2, A3, A4, and A5 together to give you the sum.

Resolution is important for display screens because it determines the clarity and detail of the images and text displayed.

A foreign key in a database is used to establish a relationship between two tables, ensuring data integrity by enforcing referential integrity constraints.

Some important short questions

Computer security basically is the protection of computer systems and information from harm, theft, and unauthorized use. It is the process of preventing and detecting unauthorized use of your computer system.

Data is a collection of facts, while **information** puts those facts into context. While data is raw and unorganized, information is organized. Data points are individual and sometimes unrelated. Information maps out that data to provide a big-picture view of how it all fits together

e-commerce: The exchange or buying and selling of commodities on a large-scale involving transportation from 1 place to another place is known as commerce. When all this is done electronically, it is known as e-commerce.

Examples of e-commerce marketplace platforms include the following: Alibaba, Amazon, olx, eBay, Daraz Facebook market etc.

cache memory, supplementary memory system that temporarily stores frequently used instructions and data for quicker processing by the central processing unit (CPU) of a computer.

Microsoft Word is a word processing program that can be used to type documents, from simple letters to illustrated newsletters.

Microsoft Excel is a spreadsheet program that can be used to track of lists, numbers and statistics, such as might be used in accounting.

A protocol is a set of rules that governs the communications between computers on a network. These rules include guidelines that regulate the following characteristics of a network: access method, allowed physical topologies, types of cabling, and speed of data transfer.

A robot is a type of automated machine that can execute specific tasks with little or no human intervention and with speed and precision.

A modem, which stands for "modulator-demodulator," is a device connecting your home to your internet service provider (ISP) through a physical connection.

A router is a device that connects two or more packet-switched networks or subnetworks. It serves two primary functions: managing traffic between these networks by forwarding data packets to their intended IP addresses, and allowing multiple devices to use the same Internet connection.

LONG

1. Types of computers (usage also)
2. Computer virus>its types, (imp)>How to safe our-self
