

Five phases of project management life cycle.

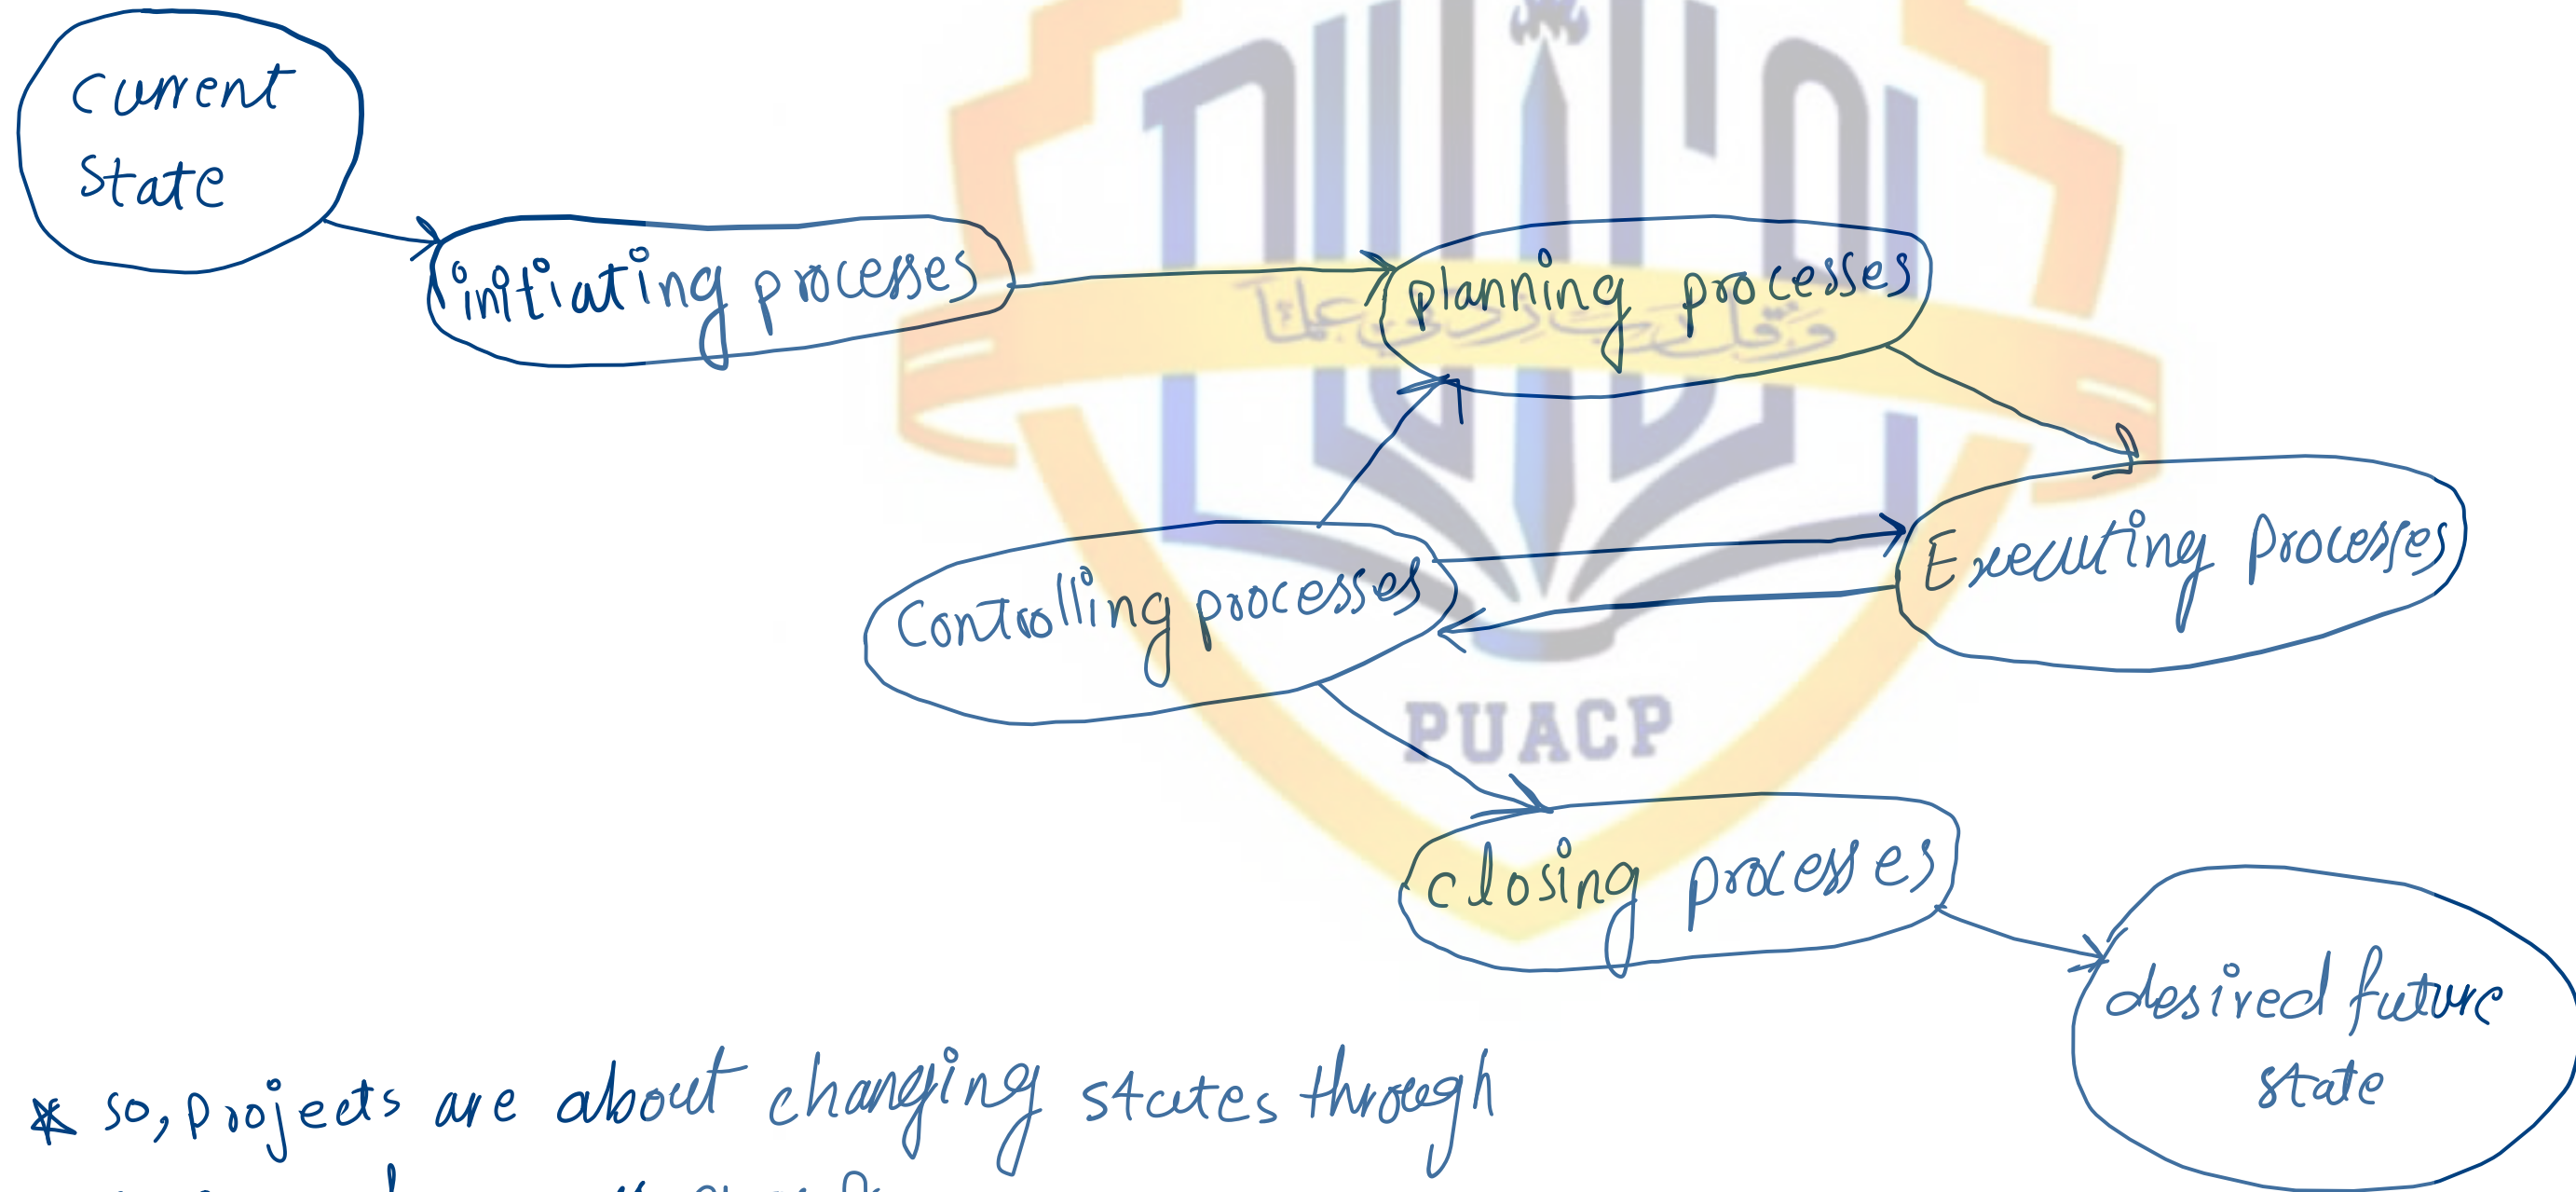

- * All projects go through five process groups defined by project management institute (PMI).
- * A process group is a mini life cycle that moves project one step closer to completion.
- * The process groups are cycles because they don't happen just once.
- * They are repeated throughout the project as many time as needed.

- ✓ Initiating The project is in the process of getting selected, sponsored, funded, and launched.
- ✓ Planning Planning is an iterative process. Planning basically determines how project work will get accomplished.
- ✓ Executing After you get a plan, your project team does the work.
- ✓ Controlling your project team does the work, but you control them.
- ✓ Closing After the project work has been completed, you tie up the loose ends and close out software project.

Moving from here to there

* we like to think of projects in two states. The states that all project stakeholders envision is current state and desired future state.

* so, projects are about changing states through series of process groups.

* The current state is easy to see: the problems, the opportunity the project will achieve, the reasons why project should happen, and so on.

* The future is tougher to see: As you are expecting stakeholders to see what is invisible. you'll help them see this through questions, interviews and past experience on similar projects, so you and stakeholders have vision in mind.
