

Biochemistry: Scope, Molecular Basis, and Living Cells

Scope and Molecular Basis of Biochemistry in Life

1. Introduction to Biochemistry

Biochemistry is the branch of science that explores the chemical processes and substances that occur within living organisms. It sits at the intersection of biology and chemistry, providing a molecular understanding of biological processes.

1.1 Scope of Biochemistry

- Study of biomolecules (proteins, carbohydrates, lipids, nucleic acids)
- Analysis of metabolic pathways and energy transformations
- Investigation of enzyme kinetics and mechanisms
- Exploration of molecular genetics and gene expression
- Understanding cellular signaling and communication
- Application in medicine, agriculture, and biotechnology

1.2 Significance in Daily Life

Biochemistry impacts numerous aspects of daily life including:

- Medical diagnoses and treatments
- Drug development and pharmacology
- Nutrition and metabolism
- Forensic science
- Agricultural improvements
- Environmental monitoring

2. Molecular Basis of Life

2.1 Chemical Elements in Living Organisms

The most abundant elements in living organisms:

- Carbon (C): Forms the backbone of biomolecules
- Hydrogen (H): Participates in most organic compounds
- Oxygen (O): Essential for cellular respiration
- Nitrogen (N): Key component of proteins and nucleic acids
- Phosphorus (P): Vital for ATP and nucleic acids
- Sulfur (S): Found in certain amino acids

2.2 Water as the Universal Solvent

Water plays crucial roles in biochemical processes:

- Serves as a medium for biochemical reactions
- Participates directly in hydrolysis and condensation reactions
- Stabilizes protein structures through hydrogen bonding
- Facilitates transport of substances within organisms
- Maintains cellular homeostasis through its thermal properties

2.3 Biomolecules

2.3.1 Carbohydrates

Basic structure: $(CH_2O)_n$

Functions:

- Energy storage (glycogen, starch)
- Structural components (cellulose, chitin)
- Cell recognition and communication (glycoproteins)

2.3.2 Lipids

Characteristics: Hydrophobic or amphipathic molecules

Functions:

- Energy storage (triglycerides)
- Cell membrane components (phospholipids, cholesterol)
- Signaling molecules (steroid hormones, eicosanoids)
- Insulation and protection

2.3.3 Proteins

Building blocks: 20 standard amino acids

Structural levels:

- Primary: Amino acid sequence
- Secondary: Regular structures (α -helices, β -sheets)
- Tertiary: Three-dimensional folding
- Quaternary: Multiple polypeptide chains

Functions:

- Enzymatic catalysis
- Structural support
- Transport
- Defense (antibodies)
- Regulation (hormones)
- Movement (contractile proteins)

2.3.4 Nucleic Acids

Types: DNA and RNA

Building blocks: Nucleotides (pentose sugar, phosphate group, nitrogenous base)

Functions:

- Storage of genetic information (DNA)

- Protein synthesis (mRNA, tRNA, rRNA)
- Regulation of gene expression (miRNA, siRNA)

3. Introduction to Living Cells

3.1 Cell Theory

- All living organisms are composed of one or more cells
- The cell is the basic structural and functional unit of life
- All cells arise from pre-existing cells

3.2 Common Features of All Cells

- Plasma membrane: Selectively permeable barrier
- Genetic material: DNA containing genes
- Cytoplasm: Aqueous medium containing organelles
- Ribosomes: Sites of protein synthesis
- Metabolic machinery: Enzymes and metabolic pathways

4. Prokaryotic Cells

4.1 General Characteristics

- Typically smaller (0.1-5.0 μm)
- Lack membrane-bound organelles
- No defined nucleus
- Circular DNA in nucleoid region
- Simple internal structure

4.2 Structure and Components

- **Cell Wall:** Composed of peptidoglycan (bacteria) or pseudopeptidoglycan (archaea)
- **Plasma Membrane:** Phospholipid bilayer with proteins

- **Nucleoid:** Region containing circular DNA
- **Ribosomes:** 70S type (smaller than eukaryotic)
- **Plasmids:** Small, circular DNA molecules
- **Capsule/Slime Layer:** External protective covering (in some)
- **Pili:** Hair-like appendages for attachment or DNA transfer
- **Flagella:** Structures for movement

4.3 Types of Prokaryotes

- **Bacteria:** Diverse group including pathogens, symbionts, and free-living forms
- **Archaea:** Often found in extreme environments (thermophiles, halophiles, methanogens)

4.4 Metabolic Diversity

Prokaryotes exhibit remarkable metabolic diversity:

- **Photoautotrophs:** Use light energy and CO₂ (cyanobacteria)
- **Chemolithoautotrophs:** Use inorganic compounds for energy
- **Heterotrophs:** Require organic carbon sources
- **Aerobic:** Require oxygen
- **Anaerobic:** Live without oxygen

5. Eukaryotic Cells

5.1 General Characteristics

- Larger (10-100 μm)
- Contain membrane-bound organelles
- DNA enclosed in nuclear membrane
- Complex internal compartmentalization
- Found in protists, fungi, plants, and animals

5.2 Structure and Components

5.2.1 Membrane-Bound Organelles

- **Nucleus:** Houses DNA, surrounded by nuclear envelope with pores
- **Endoplasmic Reticulum (ER):**
 - Rough ER: Studded with ribosomes, involved in protein synthesis
 - Smooth ER: Lacks ribosomes, involved in lipid synthesis and detoxification
- **Golgi Apparatus:** Modifies, sorts, and packages proteins for secretion or use within the cell
- **Lysosomes:** Contain digestive enzymes for breaking down cellular waste and debris
- **Peroxisomes:** Contain enzymes for oxidative reactions, especially for detoxification
- **Mitochondria:** Sites of cellular respiration and ATP production
- **Chloroplasts:** Sites of photosynthesis (in plants and algae)
- **Vacuoles:** Storage compartments for water, nutrients, waste products

5.2.2 Non-Membrane-Bound Components

- **Cytoskeleton:** Network of protein filaments providing structure and facilitating movement
 - Microfilaments (actin filaments)
 - Intermediate filaments
 - Microtubules
- **Ribosomes:** 80S type, larger than prokaryotic ribosomes
- **Centrosomes:** Microtubule organizing centers with centrioles (in animal cells)

5.3 Types of Eukaryotic Cells

5.3.1 Animal Cells

- Lack cell walls
- Contain centrioles
- Often have small vacuoles
- Store glycogen as energy reserve

5.3.2 Plant Cells

- Have cellulose cell walls
- Contain chloroplasts
- Have large central vacuole
- Store starch as energy reserve
- Contain plasmodesmata for intercellular communication

5.3.3 Fungal Cells

- Have chitin cell walls
- Lack chloroplasts
- Store glycogen as energy reserve

5.3.4 Protist Cells

- Highly diverse group
- May have characteristics similar to animal, plant, or fungal cells
- Often have specialized structures for movement (flagella, cilia)

6. Prokaryotes vs. Eukaryotes: Comparative Analysis

Feature	Prokaryotes	Eukaryotes
Cell size	0.1-5.0 μm	10-100 μm
Nucleus	Absent (nucleoid region)	Present (membrane-bound)
DNA structure	Circular, usually single	Linear, multiple chromosomes
Membrane-bound organelles	Absent	Present
Ribosome type	70S	80S
Cell division	Binary fission	Mitosis/meiosis
Cell wall composition	Peptidoglycan (bacteria)	Cellulose (plants), chitin (fungi), absent (animals)

Flagella structure	Simple, composed of flagellin	Complex, 9+2 microtubule arrangement
Gene organization	Operons common	Genes typically individually regulated
Examples	Bacteria, archaea	Protists, fungi, plants, animals

7. Biochemical Processes in Cells

7.1 Metabolism

The sum of all chemical reactions in cells:

- **Catabolism:** Breakdown of complex molecules (releases energy)
- **Anabolism:** Synthesis of complex molecules (requires energy)

7.2 Energy Transformations

- **ATP:** Universal energy currency
- **Cellular Respiration:** Process of converting nutrients to ATP
- **Photosynthesis:** Conversion of light energy to chemical energy (in plants, algae, and some bacteria)

7.3 Information Flow

Central dogma of molecular biology:

- DNA replication: Copying genetic information
- Transcription: DNA to RNA
- Translation: RNA to protein

8. Conclusion

Biochemistry provides the fundamental understanding of life at the molecular level. The study of biomolecules and their interactions within living cells—whether prokaryotic or eukaryotic—reveals the intricate and elegant mechanisms that sustain life. This molecular perspective bridges the gap between chemistry and biology, offering insights into both normal physiological processes and disease mechanisms. The distinction between prokaryotic and eukaryotic cells

represents one of the most significant evolutionary transitions in the history of life, with profound implications for cellular biochemistry, metabolism, and complexity.
