

Deletion in BST

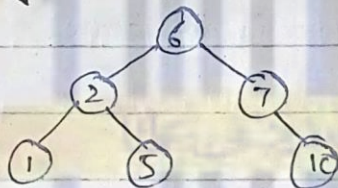

① Deleting a leaf Node.

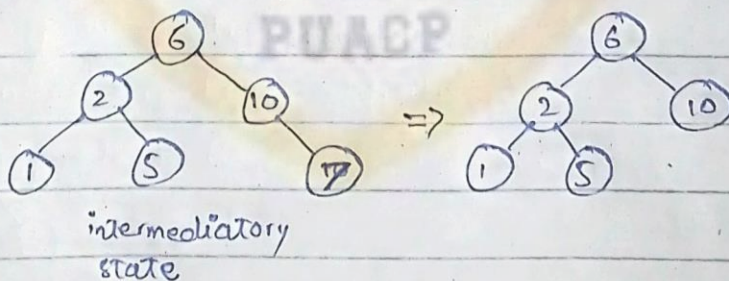

suppose, we need to delete 10.

② Deleting a Node with one child.

suppose, we need to delete 7.
replace its data with its only child.
Then delete that child.

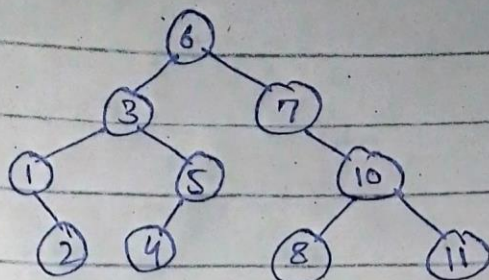

③ Deleting a Node with both children.

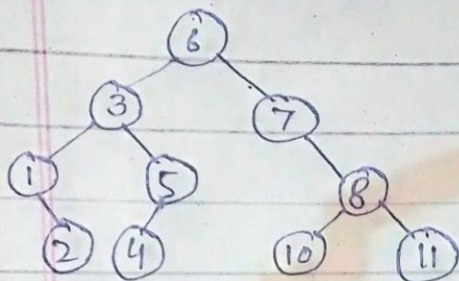

To delete a node with both childrens,
we have two approaches:

- Replace Node with left-subtree's largest (Right Most)
- Replace Node with right-subtree's smallest (left Most).

① First Approach

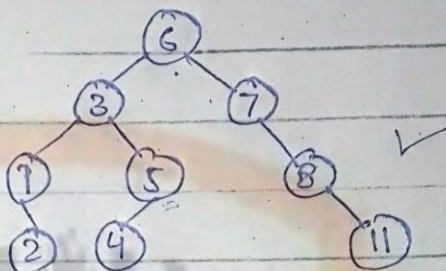

Delete 10

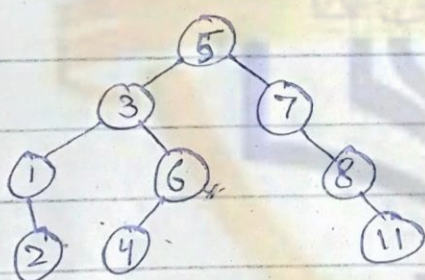

intermediatary state.

=>

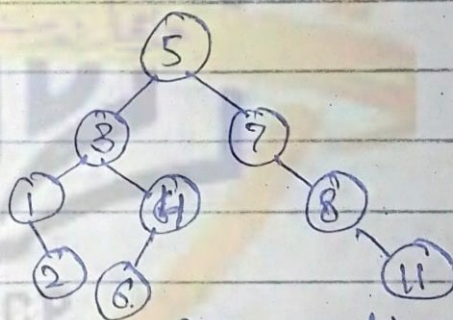

final state.

Delete 6

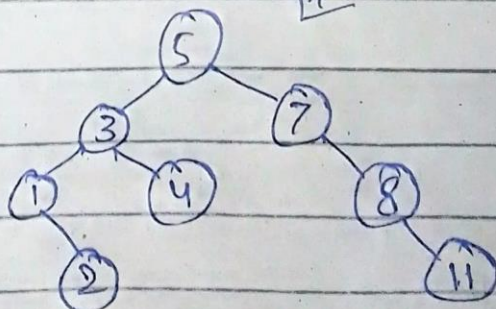

intermediatary state

=>

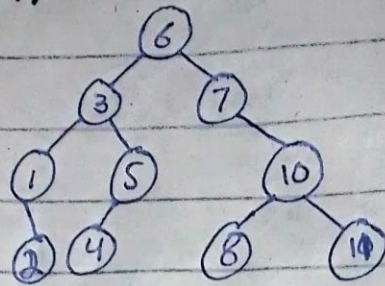

intermediatary state.

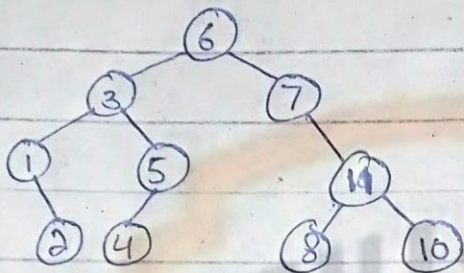

↙ ↘

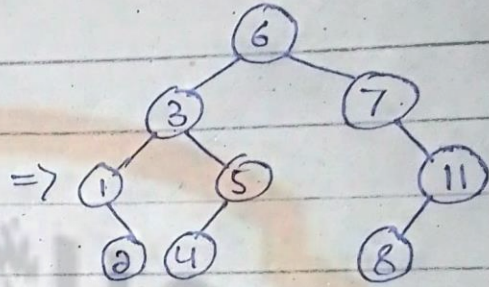

② 2nd Approach

Delete 10

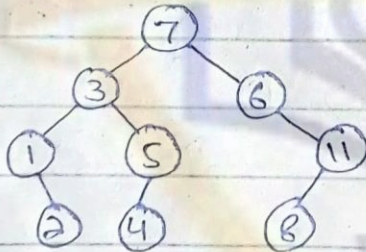

intermediatory state

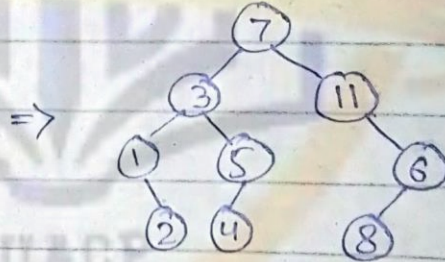

final state

Delete 6

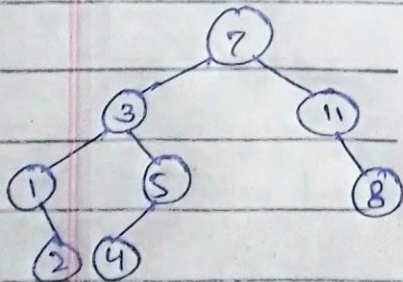

intermediatory state.

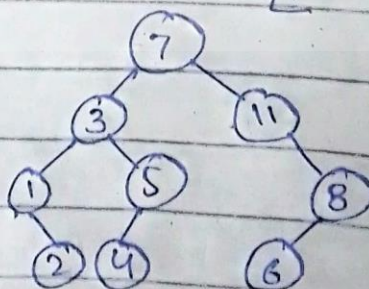

intermediatory state.

1/2

final state

⇐

intermediatory state.
